Joins

FE8828 Programming Web Applications in Finance (1)

Lecture 7: Data Part 2

3 of 69 11/16/2017, 1:34 AM

FE8828 Programming Web Applications in Finance (1)

file:///D:/Dropbox/Docs/MFE/FE8828/notes/lec07.html#(1)

left_/right_/anti_/full_join

```
| Position_id | Buy/Sell | Quantity | Risk Factor |
|------|
```

Positions are additive (to close a position, we won't change the original position but to do a new reverse trade). Suppose we have two days of position data.

```
new_data <- filter(position, date == new_date)
old_data <- filter(position, date == old_date)</pre>
```

In order to find the new positions. We will use:

```
# order matters, new_data needs to be placed first.
anti_join(new_data, old_data, by = "position_id")
```

In order to find old positions, we will use:

```
# inner_join ignores order
inner_join(new_data, old_data, by = "position_id")
left_join(old_data, new_data, by = "position_id") # produce the same result
right_join(new_data, old_data, by = "position_id") # produce the same result
```

file:///D:/Dropbox/Docs/MFE/FE8828/notes/lec07.html#(1)

FE8828 Programming Web Applications in Finance (1) file:///Dz/Dropbox/Docs/MFE/FE8828/notes/lec07.html#(1)

left_join / right_join

Can be used to do mapping table (aka. vlookup)

Table Product:

Table Transaction:

Table Customer:

FE8828 Programming Web Applications in Finance (1)

file: ///D: /Dropbox/Docs/MFE/FE8828/notes/lec07.html#(1)

11/16/2017, 1:34 AM

full_join and anti_join

- full_join(a, b): Find all combinations between table a and b.
- anti_join(a, b): Find those in a but not in b.

0 rows

```
anti join(y, x, by = c("job", "education"))
```

0 rows

Use left join to create a full report

```
left join(Transaction, Product, by = "type code") %>%
left_join(Customer, by = "customer_id")
| type_code | quantity | customer_id | type_name | customer_phone |
| 1
| 2
           1 3
                                                1 +456
                                    banana
| 3
           1 4
                      I C
                                                | +789
| 2
           | 2
                      | D
                                    | banana
                                                | NA
                      | B
                                    | orange
                                                | +456
```

FE8828 Programming Web Applications in Finance (1)

file:///D:/Dropbox/Docs/MFE/FE8828/notes/lec07.html#(1)

Join is a set operation

```
■ full_join is *
```

- anti join is -
- inner_joins is -, /
- left_join/right_join is either just the same, or *, /.

group by/summarize

Group by is our way leading to analyze the data.

```
group_by(df, ...) ... is the list of variables
summarize(df, new_field = some_func_can_process_bulk_data())
```

Function can process bulk data: Note: I often forgot there are existing functions that resort to longer versions.

- sum/mean/median/sd: basic statistics
- min(x), quantile(x, 0.25), max(x): min/max/quantile
- n()/n distinct(): count and count distint
- ntile: a rough divide into a few groups
- first(x), nth(x, 2), last(x):

group_by and summarise/summarize: Further expository

- group by is a like folding a paper without tearing it later.
- summarise will tear the paper.
- Therefore, group_by can be used with other verbs, mutate, filter, which will work within the group.
- summarise can be used without group_by, then it will apply to entire data as one whole group.

rowwise

Sometimes, we need to use rowwise() which is a special group_by which just makes every one row a group. Use case, it applies to complex logic that can't be applied as a group.

```
df <- data.frame(throw_dices = 1:10)
rowwise(df) %>% mutate( mean = mean(sample(1:6, throw_dices, replace =
```

throw_dices	mean
<int></int>	<ld><ld><</ld></ld>
I	5.000000
2	1.500000
3	2.000000
4	4.000000
5	3.000000
6	3.833333
7	4.142857
8	3.000000
9	3.888889
10	4.200000

bind_cols

■ bind cols is to extend the data frame in width.

Use cases - It's a lazyman's left join or select - It copies the columns - I usually find it useful to generate data frame for reports.

```
dt1 <- bind cols(select(bank, job), select(bank, education))</pre>
dt1[1:3,]
```

	job	education
	<fctr></fctr>	<fctr></fctr>
ı	unemployed	primary

11/16/2017, 1:34 AM

tidyr: gather/spread

FE8828 Programming Web Applications in Finance (1)

Wide format <=> Long format

- Wide format is more familiar to us. Column name is the data attribute.
- Long format is what we reformat the data that common attributes are gathered together as a single variable.
- Reference: Tidy data https://en.wikipedia.org/wiki/Tidy_data

3. To evaluate a portfolio of options for its total value.

```
GBSOption(TypeFlag = "p", S = 3500, X = 3765,
          Time = 1/12, r = 0, b = 0, sigma = 0.3)@price
## [1] 300.0049
df <- data.frame(type = sample(c("c", "p"), 100, replace = T),</pre>
                 strike = round(runif(100) * 100, 0),
                 underlying = round(runif(100) * 100, 0),
                 Time = 1,
                 r = 0.01,
                 b = 0,
                 sigma = 0.3)
```

Rules of Thumb for design data storage

- Use list to store app data, i.e. configuration.
- User data frame to store repeating data of similar structure
- Every data frame is better to have a column with the function of item_id. It can be number or character. Make it unique. If item_id is a number, when insert new record to the data frame, we need to increment it somewhere. So, store it somewhere.
- Delete is not good for customer data. add a column name with a common name, e.g. SYS DEL.

CRUD in dplyr

Create:

■ add new rows. bind rows()

Read:

■ You have known enough: filter/select/joins/... to get what you need.

Update:

■ Use either data frame way or mutate.

Assignment

I. Exploratory Data Work on the bank dataset. Find 10 findings from data. Use R Markdown.

```
title: "FE8828 Assignment for Exploratory Data Analysis"
author: "Yang Ye <sub> <Email:yy@runchee.com> </sub>
date: "Nov 15, 2017"
output: html document
```{r setup, include=FALSE}
library(tidyverse)
library(lubridate)
library(bizdays)
knitr::opts chunk$set(echo = FALSE, fig.align="center", collapse = TRUE, cache = T)
bank <- read.csv("https://goo.gl/PBQnBt", sep = ";")</pre>
Finding #1
This data contains `r nrow(data)` rows.
Finding #2
 \{r, echo = F\}
Find the big age group
 group by (age group = (age %/% 10) * 10) %>%
 summarise(count = n()) %>%
 arrange(age_group) -> res
```

FE8828 Programming Web Applications in Finance (1) file:///D://Dropbox/Docs/MFE/FE8828/notes/lec07.html#(1)

distinct(bank1, taxable)

Delete:

- Use filter to exclude the row(s).
- (Advanced version) Create a column DELETED of logic type, if we need to delete the row, set it T. We need to change all read commands to have ! DELETED

FE8828 Programming Web Applications in Finance (1)

file:///D:/Dropbox/Docs/MFE/FE8828/notes/lec07.html#(1)

and 2017-09-30. Make it more realistic, deposite is 1-2 times per month, a random number of 3000-5000. Spend/Withdraw can be any times and any amount. Deposit is positive, Withdraw/Spend is negative. You can't withdraw more than the deposit, can't spend more than credit + deposit.

4. Generate report for transaction as month-end statement in SGD.
